Safety data sheet Nitrous oxide.

Creation date :	27.01.2005	Version : 2.0	DE / E	SDS No. : 8330
Revision date :	05.01.2011			page 2 / 3

Use no oil or grease. Do not allow backfeed into the container. Suck back of water into the container must be prevented. Use only properly specified equipment which is suitable for this product, its supply pressure and temperature. Contact your gas supplier if in doubt. Keep away from ignition sources (including static discharges). The substance must be handled in accordance withgood industrial hygiene and safety procedures. Open valve slowly to avoid pressure shock. Refer to supplier's handling instructions. Purge system with dry inert gas (e.g. helium or nitrogen) before gas is introduced and when system is placed out of service. Avoid suckback of water, acid and alkalis. Do not smoke while handling product. Only experienced and properly instructed personsshould handle gases under pressure. Protect cylinders from physical damage; do not drag, roll, slide or drop. Never use direct flame or electrical heating devices to raise the pressure of a container. Do not remove or deface labels provided by the supplier for the identification of the cylinder contents. When moving cylinders, even for short distances, use a cart (trolley, hand truck, etc.) designed to transport cylinders. Leave valve protection caps in place until the container has been secured against either a wall or bench or placed in a container stand and is ready for use. Ensure the complete gas system has been (or is regularily) checked for leaks before use. If user experiences any difficulty operating cylinder valve discontinue use and contact supplier. Close container valve after each use and when empty, even if still connected to equipment. Never attempt to repair or modify container valves or safety relief devices. Damaged valves should be reported immediately tothe supplier. Replace valve outlet caps or plugs and containercaps where supplied as soon as container is disconnected from equipment. Keep container valve outlets clean and free fromcontaminates particularly oil and water. Never attempt to transfer gases from one cylinder/container to another. Keep equipment free from oil and grease

Storage

Secure cylinders to prevent them falling. Segregate from flammable gases and other flammable materials in store. Keep container below 50°C in a well ventilated place. Observe all regulations and local requirements regarding storage of containers. Containers should not be stored in conditions likely to encourage corrosion. Containers should be stored in the vertical position and properly secured to prevent falling over. Stored containers should be periodically checkedfor general conditions and leakage. Container valve guards or caps should be in place. Store containers in location free from fire riskand away from sources of heat and ignition. Keep away from combustible materials

8 EXPOSURE CONTROLS/PERSONAL PROTECTION

Exposure limit value Value type	value	Note
Germany - AGW	100 ppm	TRGS 900
TLV (ACGIH)	50 ppm	ACGIH 1995 - 1996

Personal protection

Do not smoke while handling product. Ensure adequate ventilation. Carry working gloves and protection shoes while handling gas cylinders.

9 PHYSICAL AND CHEMICAL PROPERTIES

General information

Appearance/Colour: Colourless gas. Odour: Sweetish. Poor warning properties at high concentrations.

Important information on environment, health and safety Molecular weight: 44 g/mol

Melting point: -90,81 °C Boiling point: -88,5 °C Critical temperature: 36,4 °C Autoignition temperature: Not applicable. Flammability range: Not applicable. Relative density, gas: 1,4 Relative density, liquid: 1,2 Vapour Pressure 20 °C: 50,8 bar Solubility mg/l water: 2,2 mg/l Maximum filling pressure (bar): 50 bar Other data

Gas/vapour heavier than air. May accumulate in confined spaces, particularly at or below ground level.

10 STABILITY AND REACTIVITY

Stability and reactivity

May react violently with reducing agents. May react violently with combustible materials. Violently oxidises organic material. Liquid spillages can cause embrittlement of structural materials. At temperatures above 575°C and at atmospheric pressure, nitrous oxide decomposes into nitrogen and oxygen. The escaping oxygen results in a higher fire hazard. Under pressure N20 can decompose above 300°C in nitrogen and oxygen. The decomposition can build up a high pressure, which may cause containers to rupture. The decomposition is promoted by catalysts such as nickel, gold or platinum. Thermal decomposition yields toxic products which can be corrosive in the presence of moisture.

Hazardous decomposition products

Statements on decomposition

Thermal decomposition yields toxic products which can be corrosive in the presence of moisture.

11 TOXICOLOGICAL INFORMATION

General

No known toxicological effects from this product.

12 ECOLOGICAL INFORMATION

General

No known ecological damage caused by this product. Global Warming Potential GWP 296

13 DISPOSAL CONSIDERATIONS

General

May be vented to atmosphere in a well ventilated place. Discharge to atmosphere in large quantities should be avoided. Do not discharge into areas where there is a risk of forming an explosive mixture with air. Waste gas should be flared through a suitable burner with flash back arrestor. Contact supplier if guidance is required.
